RESULT 15

15.7754

histidinol-phosphate aminotransferase hisC-1 - Synechocystis sp. (strain PCC 6803)

NyAlternate names: protein sll1713

C; Species: Synechocystis sp.

C; Species: Synechocystis sp.

C; Avariety: PCC 6803

C; Accession: S77354

R; KaneKo, T.; Sato, S.; Kotani, H.; Tanaka, A.; Asamizu, E.; Nakamura, Y.; Miyajima, N.;

C; N.; Okumura, S.; Shimpo, S.; Takeuchi, C.; Wada, T.; Watanabe, A.; Yamada, M.; Yasuda

DNA Res. 3, 109-136, 1996

A; Title: Sequence analysis of the genome of the unicellular cyanobacterium Synechocystis

A; Reference number: S74322; MUID:97061201; PMID:8905231
A; Accession: S77354
A; Accession: S77354
A; Accession: S77354
A; Status: nucleic acid sequence not shown; translation not shown
A; Molecule type: DNA
A; Ross-references: EMBL:D90906; GB:AB001339; NID:g1652492; PIDN:BAA17457.1; PID:g165253
A; Cross-references: EMBL:D90906; GB:AB001339; NID:g1652492; PIDN:BAA17457.1; PID:g165253
A; Note: the nucleotide sequence was submitted to the EMBL Data Library, June 1996
C; Genetics:
A; Genetics:
C; Superfamily: probable histidinol-phosphate transaminase

Gallagher T.M., Buchmeier M.J.;

Virology 279:371-374(2001).

-I- FUNCTION: Structural protein that makes spikes at the surface of the virus. Initiates infection by specifically recognizing and binding the human aminopeptidate ANPEP receptor. Its association with ANPEP may lead to its conformational change that triggers fusion between viral and host cellular membrane.

-I- SUBUNIT: Homotrimer, During virus morphogenesis, it is found in a complex with M and HE proteins (By similarity). Interacts with
Udentification of a receptor-binding domain of the spike glycoprotein of human coronavirus HCoV-229E."; J. Virol. 77:2530-2538(2003).

"Nucleotide sequence of the gene coding for the peplomer protein (=
spike protein) of infectious bronchitis virus, strain D274.";

Nucleot Acids Res. 17.6726-6726 (1389).

-I. FUNCTION: THE PEPLOMER PROTEIN MEDIATES THE BINDING OF VIRIONS
TO THE HOST CELL RECEPTOR AND IS INVOLVED IN MEMBRANE FUSION.
                                                                        Avian infectious bronchitis virus (strain D274) (IBV).
Viruses; ssRNA positive-strand viruses, no DNA stage; Nidovirales;
Coronaviridae; Coronavirus.
                                                        (Peplomer protein)

The complete genome of hyperthermophile Methanopyrus kandleri AV19

and monophyly of archaeal methanogens.", 99:4644-4649(2002).

Proc. NaII. Acad. Sci. U.S.A. 99:4644-4649(2002).

-I- FUNCTION: Modulates the activity of chromatin proteins, thereby

C -I- CHALNTIC ACTIVITY: NAD(+) + an acetylprotein = nicotinamide + O-

acetyl-App-ribose + a protein.

-I- COFACTOR: Binds 1 zinc ion and NAD (By similarity).

-I- SUBCELLULAR LOCATION: Cytoplasmic (Probable).

-I- SIMILARITY: Belongs to the sirtuin family.
                                                                                                                                            NPDA OR MK1075.

## ALIGNMENTS

AAY24550 standard; peptide; 12 AA. RESULT 1 AAY24550

(first entry) 18-AUG-1999

AAY24550;

Indolicidin analogue #2.

Indolicidin; bacterial infection; photo-oxidised solubiliser; autinicrobial; antibiotic; antiarrythmic; surface disinfectant; additive; shampoo; soap; insecticide; herbicide; preservative; food; technical material. 

Synthetic.

W09807745-A2

26-FEB-1998,

97WO-US014779. 21-AUG-1997;

96US-0024754P. 97US-0034949P. 21-AUG-1996; 13-JAN-1997; (MICR-) MICROLOGIX BIOTECH INC.

Taylor R, Erfle D; Fraser JR, West MH, Krieger TJ,

WPI; 1998-169090/15.

New indolicidin analogues with antimicrobial activity and related nucleic acid - vectors, transformed cells and antibodies, also conjugates with polyoxyalkylene glycol and fatty acid to reduce toxicity, useful therapeutically, as disinfectants etc.

Claim 11; Page 88; 129pp; English.

AAY24549 to AAY24615 represent indolicidin analogues of formulae (I)(VIII) containing up to 25 amino acids (aa): RXZXZXB (I), BXZXXZXB (II),
BBBZXXXXZB (III), BXZXXZXBBM(AA)nMILBBAGS (IV), BXZXXZXBB(AA)nM (V),
IBBRZXXXZXBK (VI), LKNXZXXZRBK (VII) and BBXZXXXZXBBB (VIII). Where Z = P or V; X = hydrophobic residue, preferably W; B = basic aa, preferably R
or K; AA = any aa; n = 0 or 1; in (II), at least 1 Z = V; in (VIII) at
least 2 X = F or Y. The analogues are used to treat infections caused by
bacteria (Gram positive or negative, or anaerobic); fungi (Yeast or
moulds); parasites (protozoa, nematodes, cestodes or trematodes) or

```
viruses. Typical of very many pathogens that can be controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola hepatica, Katbasiella pneumoniae, Bordetella pertussis, Staphylococous aureus, Listeria, Clostridium, rotavirus and papilloma virus. Compounds derived from the analogues may be used similarly; the compounds may also be used therapeutically or to coat medical devices; also they are useful as surface disinfectants, as additives to shampoo or soaps, as insecticides or herbicides, or as preservatives for foods and technical materials. The analogues are administered by injection, lavage, orally or topically, generally at 0.1-50 mg/Kg. These analogues have a broader spectrum of activity than indolicidin and modification as compounds reduces their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              domain fusion protein expression cassette comprising a promoter and a nucleic acid molecule expressed as an insoluble protein. The inclusion of anionic peptide sequences in the linker sequences neutralises the positive charge of the cationic peptide so that the charge of the fusion protein is controlled. This cassette allows high yield, stable production of the cationic peptides such as bovine indolicidin may be used as antimicrobial agents. The present sequence is the MBI-11B7 peptide. MBI-11B7 is a cationic peptide derived from modifications of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cellulose binding domain; CBD; cationic peptide; MBI-11B7; indolicidin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A novel method allows the efficient production of cationic peptides in recombinant host cells. The method involves construction of a multi-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Multi-domain fusion protein expression cassette used for high yield stable production of foreign peptide gene products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistent phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                  Cationic peptide, tumour; pharmaceutical composition; cancer; treatment; leukaemia; polyoxyalkylene-modified; APO; lymphoma; multiple myeloma; breast; lung; ovary; cervix; uterus; skin; prostate; liver; colon;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel pharmaceutical composition containing optionally activated polyoxyalkylene-modified cationic peptides, useful for treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            West MHP;

01-JAN-2004 (first entry)
The present invention describes a composition (A) comprising an antimicrobial cationic peptide (I), a viscosity-increasing agent (II) and antimicrobial cationic peptide (I), a viscosity-increasing agent (II) and (III). (I) has antibacterial, virucide, antimifiammatory, (I), buffer (IV) and (III). (I) has antibacterial, virucide, antimifiammatory, fungicide, protozoscide, parasiticide, vulnerary, dermatological, (I) buffer (E) therbicide and insecticide activities. (A) can be used to reduce the population of microfilora (eukaryotes, proxaryotes or viruses) at a target site, particularly for treatment or prevention of infections. They can be used to treat a wide range of systemic infections (e.g. sepsis) and for topical treatment of wounds, but most especially can be used: (i) at sites where medical devices have been, or will be, inserted into the body (alternatively, they are used to treat the devices); and (ii) at sites on the skin (particularly for treating acne) or the mucosa. The devices treated are especially central venous, vascular dialysis, pulmonary or artery, peritornal dialysis or umbilical catheters. They may also be used as surface diainfectants; for treatment of clothing and air filters; in cometics and soaps; as herbicides and insecticides; in building materials (e.g. silicone sealants) and in processing animal products, e.g. hides. The present sequence respresence an antimitrobial actionic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition containing stabilized antimicrobial cationic protein, useful for treating infections, particularly where associated with in-dwelling

The analogue of the invention demonstrates antiseborrheic, dermatological, antiserthritic, immunosuppressive, vulnerary, antistritritic, antimulation with antipruritic, antimulation antipruritic, neuroprotective and antiproristic and may be useful for treating or preventing inflammation at a target site. The inflammation at the target site may be associated with a condition selected from acne, arthritis, autoimmune disease, burn, crohn's disease, colitis, contact hypersensitivity, delayed hypersensitivity, eczema, endotoxin shock syndrome, fibromyositis, graft rejection, microbial infection, multiple sclerosis, parapsoriasis, psoriasis, solerosis and seborrhea. The current sequence is that of the synthetic indolicidin analogue peptide of the invention.
                                                 indolicidin analogue; antiseborrheic; dermatological; antiinflammatory; antiarthritic; immunosuppressive; vulnerary; antipruritic; antimicrobial; antipruritic; neuroprotective; antipsoriatic; inflammation; acne; arthritis; uctoimmune disease; burn; Crohn's; colitis; colitis; contact hypersensitivity; delayed; eczema; endotoxin shock syndrome; fibromyositis; graft rejection; microbial infection; multiple sclerosis; parapsoriasis; psoriasis; sclerosis; seborrhea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel indolicidin analog useful for treating or preventing inflammation at a target site associated with a condition such as acne, arthritis, burn, Crohn's disease, colitis, and in image analysis and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (GUAR/)
The invention relates to a novel indolicidin analogue. The analogue of the invention demonstrates antisebornheic, dermatological, antiinflammatory, antiarthritic, immunosupressive, vulnerary, antipruritic, antimicrobial, antipruritic, neuroprotective and antiproxitic, antimicrobial, antipruritic, neuroprotective and at target site. The inflammation at the target site may be associated with a condition selected from acne, arthritis, autoimmune disease, burn, crohn's disease, colitis, contact hypersensitivity, delayed hypersensitivity, eczema, endotoxin shock syndrome, fibromyositis, graft rejection, microbial infection, multiple sclerosis, parapsoriasis, prespectasis, sclerosis and seborihea. The current sequence is that of the synthetic indolicidin analogue peptide of the invention.
                                                                                                                              indolicidin analogue, antieeborrheic, dermatological; antinflammatory, antiarthritic; immunosuppressive, vulnerary, antipruritic; antimicrobial; antipruritic; neuroprotective; antipsoriatic; inflammation; acne; arthritis; autoimmune disease; burn; Crohn's; colitis; colitis; contact hypersensitivity; delayed; eczema; endotoxin shock syndrome; fibromyositis; graft rejection; microbial infection; multiple sclerosis; parapsoriasis; sclerosis; seborrhea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel indolicidin analog useful for treating or preventing inflammation at a target site associated with a condition such as acne, arthritis, burn, Crohn's disease, colitis, and in image analysis and diagnostic

                                              The invention relates to a novel indolicidin analogue. The analogue of the invention demonstrates antiseborrheic, dermatological, antisematory, antistribritio, immunosuppressive, vulnerary, antistribritio, antimucrobial, antipruritic, neuroprotective and antiproratic and may be useful for treating or preventing inflammation at a target site. The inflammation at the target site may be associated with a condition selected form acne, arthritis, autoimmune disease, burn, crohn's disease, colitis, contact hypersensitivity, delayed hypersensitivity, eczema, endotoxin shock syndrome, fibromyositis, prefection, microbial infection, multiple sclerosis, parapsoriasis, psoriasis, sclerosis and seborihea. The current sequence is that of the synthetic indolicidin analogue peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel indolicidin analogue. The analogue of antinflammatory, antiarthritic, immunosuppressive, vulnerary, antiarthritic, immunosuppressive, vulnerary, antipruritic, antimicrobial, antipruritic, neuroprotective and antipruritic, antimicrobial, artipruritic, neuroprotective and antiproriatic and may be useful for treating or preventing inflammation at the target site may be associated with a condition selected from acne, arthritis, autoimmune disease, burn, crohn's disease, colitis, contact hypersensitivity, delayed hypersensitivity, eczema, endotoxin shock syndrome, fibromyostis, purn, rejection, microbial infection, multiple sclerosis, parapsoriasis, psoriasis, psoriasis, clerosis and seborihea. The current sequence is that of the synthetic indolicidin analogue peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel indolicidin analog useful for treating or preventing inflammation at a target site associated with a condition such as acne, arthritis, burn, Crohn's disease, colitis, and in image analysis and diagnostic
                                                                                                                                                          indolicidin analogue; antiseborrheic; dermatological; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Guarna MM;

The present invention describes a composition (A) comprising an antimicrobial cationic peptide (I), a viscosity-increasing agent (II) and antimicrobial cationic peptide (I), a viscosity-increasing agent (II) and (III). Also described is a composition comprising (I), buffer (IV) and (III). (I) has antibacterial, virucide, antihifiammatory, buffer (IV) and (III). (I) has antibacterial, virucide, antihifiammatory, comparing insections entangency at the understy dermatological, composition of miscoflora (eukaryotes) prokaryotes or viruses) at a target comparing to treat a wide range of systemic infections (e.g. sepsis) and for composition of infections. They can be composed to treat a wide range of systemic infections (e.g. sepsis) and for compositions of wounds, but most especially can be used: (i) at sites where medical devices have been, or will be, inserted into the body composition (ii) at sites on the skin (particularly for treating acne) or the mucosa. The devices treated are especially central venous, vascular dialysis, pulmonary compositions and insecticides; in building compositions and in processing animal products; cometics and soaps; as herbicides and in processing animal products; composition, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                indolicidin analogue; antiseborrheic; dermatological; antiinflammatory; antiarthritic; immunosuppressive; vulnerary; antipruritic; antimicrobial; antipruritic; neuroprotective; antipsoriatic; inflammation; acne;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition containing stabilized antimicrobial cationic protein, useful for treating infections, particularly where associated with in-dwelling devices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic indolicidin analogue peptide - 11B17CN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO) -modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaenta, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                         cancer; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel pharmaceutical composition containing optionally activated polyoxyalkylene-modified cationic peptides, useful for treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antimicrobial; cationic; viscosity-increasing agent; solvent; buffer; antibacterial; virucide; antiinflammatory; fungicide; protozoacide; parasticide; vulnerary; dermatological; herbicide; insecticide; infection; systemic infection; sepsis; acne; disinfectant; herbicide; insecticide; sealant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel indolicidin analogue. The analogue of the invention demonstrates antiseborrheic, dermatological, antilificamatory, antiarthritic, immunosupressive, vulnerary, antipritarthritic, immunosupressive, vulnerary, antipritarthritic, antiprivitic, neuroprotective and antipropritic, antiprivitic, neuroprotective and antipropriatic and may be useful for treating or preventing inflammation at the target site may be associated with a condition selected from acne, arthritis, autoimmune disease, burn, crohn's disease, colitis, contact hypersensitivity, delayed hypersensitivity, eczema, endotoxin shock syndrome, fibromyositis, graft rejection, microbial infection, multiple sclerosis, parapsoriasis, periestion, aclerosis and seborrhea. The current sequence is that of the synthetic indolicidin analogue peptide of the invention.
             contact hypersensitivity; delayed; eczema; endotoxin shock syndrome; fibromyositis; graft rejection; microbial infection; multiple sclerosis; parapsoriasis; psoriasis; sclerosis; seborrhea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel indolicidin analog useful for treating or preventing inflammation at a target site associated with a condition such as acne, arthritis, burn, Crohn's disease, colitis, and in image analysis and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indolicidin analogue; resistance; cationic peptide; antibiotic; bacteria; microorganism; bacteria;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a specifically claimed cationic peptide from the present invention. The present invention describes compositions and methods for treating infection, sepecially bacterial infections. The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance; (b) acquired resistance; and (c) inherent resistance. The combinations of antibiotics and cationic peptides can provide synergistic activity antibiotics and cationic poptides can provide synergistic activity against a microorganism that is tolerant, inherently resistant, or has acquired resistance to an antibiotic agent. They can be used for killing e.g. bacteria, fungi, parasites and viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                    New indolicidin peptide analogues - useful for, e.g. enhancing activity of antibiotic or overcoming tolerance, acquired resistance or inherent resistance of microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

New indolicidin analogues with antimicrobial activity and related nucleic acid - vectors, transformed cells and antibodies, also conjugates with polyoxyalkylene glycol and fatty acid to reduce toxicity, useful therapeutically, as disinfectants etc.

Claim 11, Page 88; 129pp; English.

AAY24549 to AAY24615 represent indolicidin analogues of formulae (1)(VIII) containing up to 25 amino acids (as): RXZXXXXB (1), BXZXXXXB (II),
BBAXXXXXXB (III), BXXXXXXBBBN (AA) MNILBBAGS (IV), BXZXXXXBB (AA) MN (V),
IBBNXAXXXXKK (VII), IKNXXXXXXRBN (VIII), Where Z =
C or K; AA = any as, n = 0 or 1; in (III), at least 1 Z = V; in (VIII) at
c or K; AA = any as, n = 0 or 1; in (III), at least 2 X = F or Y. The analogues are used to treat infections caused by
bacteria (Gram positive or negative, or anaerobic); fungi (yeast or
c moulds); parasites (protozoa, nematodes, cestodes or trematodes) or
c viruses. Typical of very many pathogens that can be controlled are
Leishmania Typical of very many pathogens that can be controlled are
Leishmania Typical of very many pathogens that can be controlled are
Leishmania Typical of very many pathogens that can be controlled are
Leishmania Typical of very many pathogens that can be controlled are
Leishmania Typical of very many pathogens that can be controlled are
Leishmania Typical of very many pathogens the compounds areas.

Klabsiella pneumoniae, Bordetella pertussis, Staphylococus aureus,
Listeria, Clostridium, rotavirus and papillome virus. Compounds derived
from the analogues may be used samilarly, the compounds may also be
prepared from antibiotics or antiarrythmic agents. The analogues may be
unface disinfectants, as additives to shampoo or soaps, as insecticides
or herbicides, or as preservatives for foods and technical materials.

C analogues are administered by injection, lavage, orally or topically,
c generally at 0.1-50 mg/Kg. These analogues have a broader spectrum of
activity than indolicidin and modification as compounds reduces their 

Sequence 21 AA;

toxicity

Telated to triA protein [imported] - Neurospora crassa

N,Alternate names: protein B2A19.50

C;Species: Neurospora crassa

C;Species: Neurospora crassa

C;Date: 21-Uul-2000 #sequence_revision 21-Uul-2000 #text_change 21-Uul-2000

C;Accession: T51071

R;Schulte, U.; Aign, V.; Hoheisel, J.; Brandt, P.; Fartmann, B.; Holland, R.; Nyakatura submitted to the Protein Sequence Database, July 2000

A;Reference number: Z25286

A;Accession: T51071
C; Date: 17-Jul-1998 #sequence_revision 17-Jul-1998 #text_change 22-Oct-1999
C; Accession: B70741

RESULT 15
anthranilate synthase (EC 4.1.3.27) component I (validated) - Pseudomonas syringae pv. 8
Anthranilate synthase alpha chain
N.Alternate names: anthranilate synthase alpha chain
C.Species: Pseudomonas syringae pv. savastanoi
C.Species: Bseudomonas syringae pv. savastanoi
C.Species: Davar-2000
C.Saccesion: A39128
R.da Costa, E.; Sllva, O.; Kosuge, T.
A.Title: Molecular characterization and expression analysis of the anthranilate synthase
A.Reference number: A39128; MUD:91100331; PMID:1987141
A.Reference number: A39128
A.Status: preliminary
A.Molecule type: DNA
A.Residues: 1-505 < DAC>
A.Ganetics:
C.Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AjGene: trpE

"Indolicidin, a novel bactericidal tridecapeptide amide from neutrophila."
15 Biol. Chem. 267:4292-4295(1992).
1- FINCTION: Pocent microbicidal activity, active against Staphylococus aureus and Escherichia coli.
1- TISSUE SPECIFFITY: Large granules of neutrophils.
1- TISSUE SPECIFFITY: Large granules of neutrophils.
1- PIN: Elastase might be responsible for its maturation.
1- SIMILARITY: Belongs to the cathelicidin family.

Virology 279:371-374(2001).

'I FUNCTION: Structural protein that makes spikes at the surface of the virus. Determines enteropathogenicity and virulence of the virus. Initiates infection by specifically recognizing and binding the human aminopeptidase ANPEP receptor. Its association with ANPEP may lead to its conformational change that triggers fusion between viral and host cellular membrane.

-!- SUBUNI: Homotriner. During virus morphogenesis, it is found in a complex with M and HE proteins (By similarity). Interacts with
"Identification of a receptor-binding domain of the spike glycoprotein of human coronavirus HCOV-229E.", J. virol. 77:2530-2538(2003).

-!- DOMAIN: The leucine zipper-like heptad repeats may mediate the fusion of viral and cellular membranes.
-!- POLYMORPHISM: The strong variation between the different strains may affect the virulence of the virus.
-!- MISCELLANBOUS: In contrast to serogroup 2, E2 glycoprotein protein from serogroup 1 is not cleaved.
-!- SIMILARITY: Contains 1 spike S1 domain.
-!- SIMILARITY: Contains 1 spike S2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- SUBCELLULAR LOCATION: Type I membrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleoside 5'-phosphate.
--- ENZYME REGULATION: Inhibited by cGMP.
--- SUSCELLULAR LOCATION: Membrane-bound (Potential).
--- TISSUE SPECIFICITY: Abundant in adipose tissues.
--- SIMILARITY: Belongs to the cyclic nucleotide phosphodiesterase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ,

J. Biol. Chem. 272:29721-29728(1997).
-!-FUNCTION: May catalyze alpha-1,3 and alpha-1,4 glycosidic linkages involved in the expression of sialyl Lewis X and Lewis X/SSEA-1 antigens. It may be involved in blood group Lewis determination (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-MAY_2000 (Rel. 39, Created)

N-acetyl-D-glucosaminyl-R = GDP + beta-D-galactosyl-(1->1)-[alpha-L-fucosyl-(1->4)]-N-acetyl-beta-D-glucosaminyl-R.
-!-PATHWAY: Glycosylation.
-!-SUBCELULIAR LOCATION: Type II membrane protein. Membrane-bound form in trans cisterane of Golgi (By similarity).
-!-POLYMORPHISM: There are two alleles, A and B. Allele A has Arg-16 and Val-304. Allele B has Gly-162 and Met-304.
-!-MISCELLANEOUS: Also acts on the corresponding 1,4-galactosyl derivative, forming 1,3-L-fucosyl links.
-!-SIMILARITY: Belongs to the glycosyltransferase family 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          STRAIN=H37RV;

AAR30970 standard; peptide; 13 AA. (first entry) (revised) 25-MAR-2003 12-MAY-1993 AAR30970; RESULT 1 AAR30970 

Broad spectrum antimicrobial indolicidin peptide

Tryptophan rich; microbial; microbistatic; inhibition.

Bos taurus.

WO9222308-A1

23-DEC-1992

92WO-US004920. 10-JUN-1992;

91US-00715271. 14-JUN-1991;

(REGC ) UNIV CALIFORNIA.

Cullor JS; Selsted ME,

WPI; 1993-017896/02.

Broad spectrum antimicrobial cpd. obtd. from bovine granulocytes -comprises tryptophan rich peptide, pref. having low immunogenicity and comprising proline rich peptide or carboxy terminal amide.

Claim 2; Page 19; 29pp; English.

The sequence is that of an indolicidin peptide which shows broad spectrum antimicrobial activity and when administered to a host does not elicit an immune response. It is effective against virtuses, gram positive bacteria, gram negative bacteria and fungi, including Staphylococcus aureus. Escherichia coli, Salmonella typhimurium, Listeria monocytogenes, Candida albicans and Cryptococcus neoformans. It can be used as a therapeutic agent, food preservative or disinfectant, e.g. to purify a water supply. The peptide is pref. administered at an effective amt. of 0.5-500 ug/ml final concentration. (Updated on 25-MAR-2003 to correct PN field.)

```
AAW66393 to AAW66469 represent native cationic peptides from the present treating infection, especially bacterial infections. The compositions and methods for methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance; (b) acquired resistance; and (c) inherent resistance. The combinations of antibiotics and cationic peptides can provide synergistic activity against a microorganism that is tolerant, inherently resistant, or has acquired resistance to an antibiotic agent. They can be used for killing e.g. bacteria, fungi, parasites and viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Indolicidin, bacterial infection, photo-oxidised solubiliser, additive, antimicrobial, antibiotic, antiarrythmic, surface disinfectant, additive,
                                                                                                                                                                                           Indolicidin analogue, resistance, cationic peptide, antibiotic, oacteria, infection, tolerance, antibacterial, microorganism, bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New indolicidin peptide analogues - useful for, e.g. enhancing activity of antibiotic or overcoming tolerance, acquired resistance or inherent resistance of microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 99; DB 2; L. 100.0%; Pred. These analogues exhibit broad spectrum antimicrobial activity and have analogues exhibit broad spectrum antimicrobial activity of antimicrobial selectivity when compared to naturally occuring indolicidin. The antimicrobial activity of these analogues can be altered by incorporation of D-form, chemically altered or synthetic amino acids.
These sequences can be incorporated into a pharmaceutical composition (e.g. as a liposome or non-liposome lipid complex carrier) for use in a microbicidal method. These sequences are active against Gram positive and negative bacteria, protozoa, yeast, fungi and viruses. They can be used as therapeutic agents, prophylactics, food preservatives, disinfectants or medications. These sequences are easily synthesised in an active and effective broad spectrum antimicrobial form with decreased undesirable side effects. Compared to naturally occuring indolicidin, these analogues cannow increased antimicrobial and decreased haemolytic activity. Peptide stability, and period of activity within the cell can be increased or

                                                                                                                                                                                                                                                                                                                                                       AAY24549 to AAY24615 represent indolicidin analogues of formulae (I)-
(VIII) containing up to 25 amino acids (aa): RXZXXZXB (I), BXZXXZXB (II),
BBBAXZXXZXB (II), BXZXXZXBBBI (AA), MMILBBAGS (IV), BXZXXZXBBA, AM (V),
LBBAXZAXZXRK (VI), LKAXZXXXBBBI (AA), MHORE Z
COF K; AA = any aa; n = 0 or 1; in (II), at least I Z = V; in (VIII) at
least 2 X = F or Y . The analogues are used to treat infections caused by
bacteria (Gram positive or negative, or anaerobic); fungi (yeast or
moulds); parasites (protozoa, nematodes, cestodes or trematodes) or
viruses. Typical of very many pathogens that can be controlled are
Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola hepatica,
clostridium, rotavirus and papilloma virus. Compounds derived
from the analogues may be used smilarly; the compounds may also be
from the analogues may be used smilarly; the compounds may also be
used therapeutically or to coat medical devices; also they are useful as
surface disinfectants, as additives to shampoo or soaps, as insecticides
or herbicides, or as preservatives for foods and technical materials.
Corberbally at 0.1-50 mg/kg. These analogues have a broader spectrum of
activity than indolicidin and modification as compounds reduces their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                 New indolicidin analogues with antimicrobial activity and related nucleic acid - vectors, transformed cells and antibodies, also conjugates with polyoxyalkylene glycol and fatty acid to reduce toxicity, useful therapeutically, as disinfectants etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to mass production of antimicrobial peptides. The method comprises constructing a fusion gene containing a first gene encoding a negatively charged acidic peptide having at least two cysteine residues, and a second gene encoding a peptide having at least two cysteine antimicrobial peptide. A host microorganism is transformed with a vector containing the fusion gene and then cultured. The expressed antimicrobial peptides in recombinant microorganisms. The inhibitory effect of the expressed antimicrobial peptides in recombinant microorganisms. The inhibitory effect of the expressed antimicrobial peptide upon the growth of the host microorganism is considerably reduced by fusing it to the acidic peptide. Therefore, the use of the fusion gene provides an economic, recombinant alternative of mass producing antimicrobial peptides, which overcomes the disadvantages of low-productivity and poor economy, previously encountered by recombinant and chemical methods. The present sequence represents an antimicrobial peptide Indolicidin. The encoding DNA can be used and and acidic peptide Guamerin gene in the construction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present amino acid sequence is an antimicrobial peptide, Indolicidin derived from cow, Bos taurus. It is used along with a derivative of purF gene sequence that functions as a fusion partner. A DNA construct that comprises, this antimicrobial peptide encoding sequence and the entire, partial or derivative of purF gene, is used for mass production of the antimicrobial peptide in microorganisms without killing the host cells. Use of the purF gene derivative sequence, neutralises the toxicity of the antimicrobial peptides against the host microorganism. The antimicrobial peptides are useful commercially in the pharmaceutical and food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cationic peptide; tumour; pharmaceutical composition; cancer; treatment; leukaemia; polyoxyalkylene-modified; APO; lymphoma; multiple myeloma; breast; lung; ovary; cervix; uterus; skin; prostate; liver; colon;

The crosslinked indolicidin (X.-indolicidin) analogs are stable and have antimicrobial activity against gram positive and negative bacteria (e.g. Staphylococcus aureus, Escherichia coli and Salmonalla typhimurium), yeasts and fungi (e.g. Candida albicans, Cryptococcus neoformans), protococa (e.g. Giardia species and Acanthamoeba species), and viruees (e.g. Giardia in an environment e.g. a food or food produt, a solution, an inanimate object comprising a surface, or a mammal. The present sequence is a specifically claimed X-indolicidin analog, indol 1-13(66/9) which

                                  This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO) -modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multiding resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidary resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                                                                                                                                               Cationic peptide, tumour; pharmaceutical composition; cancer; treatment; leukaemia; polyoxyalkylene-modified; APO; lymphoma; multiple myeloma; breast; lung; ovary; cervix; uterus; skin; prostate; liver; colon;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel pharmaceutical composition containing optionally activated polyoxyalkylene-modified cationic peptides, useful for treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               West MHP

Indolicidin; bactenecin; sulphate-reducing bacteria; growth inhibitor; corrosion; degradation; metal; concrete, cement; dental implant; biofilm.

Non-amidated indolicidin peptide.

(first entry)

23-FEB-2000

AAY55056;

```
indolicidin analogs, active against bacteria, yeast, fungi, protozoa virus, used for, e.g. treating infections.
                     Indolicidin analogue, antimicrobial activity, helminth, bacteria, virus, treatment, inhibit growth, micro-organism, contact lens solution, transgenic plant, surgical instrument, yeast, fungi, protozoa.
Naturally occurring bovine indolicidin peptide Indol 1-13.
                                                                                                                         /note= "C-terminal amide"

11-NOV-11999.

This sequence represents the non-amidated indolicidin peptide. The invention relates to a method for inhibiting growth of sulphate-reducing bacteria (A) on a macerial (B) sensitive to corrosion or degradation, by applying to (B) a bacterium (C) that secretes a compound (I) able to inhibit growth of (A). The method is used to protect metal, concrete or cement against corrosion and degradation, but (B) can also be used to protect dental implants. (B) is present in an open or closed system (e.g. water cooling tower, liquid storage container, fuel tank, sewer or drainage system etc.) or part of a bridge or other structure. The method is more effective and less expensive than known methods for inhibiting (A), and reduces the amount of toxic chemicals released. Conventional biofilms of aerobic organisms tend to encourage growth of (A), and addition of (C) to the biofilm prevente this. A single application of (C) lasts for a long time, and (I) are produced exactly where they are required and inhibit (A) without significant impact on other organisms the biocides, which may then be used in reduced amounts). If local damage to the biofilm occurs, the underlying material is still protected by diffusion of (I) from neighbouring areas

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indolicidin is a potent antimicrobial tridecapeptide, originally purified from cytoplasmic granules of bovine neutrophils. A reverse peptide, Rev4 (AAY92796) of indolicidin was found to have increased stability against plant protease degradation. Expression of antimicrobial peptides in transgenic plants suffers a major limitation in that the foreign peptides are susceptible to rapid degradation by proteases. The invention concerns produced by a plant by administering indolicidin, Rev4 or a functional produced by a plant by administering indolicidin, Rev4 or a functional Rev4 are useful for production of the antimicrobial peptides. Compositions containing indolicidin and Rev4 are useful for production of the antimicrobial peptides.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3.50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases

Iffe) and specificity as bonding to large molecules decreases

intracellular uptake and interference with physiological processes.

ARBO829 to AAB9241 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                 Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.

The invention relates to an ophthalmic composition (I) for storing, cleaning, or disinfecting a contact lens, comprising an indolicidin cleaning, or disinfecting a contact lens, comprising an indolicidin less than 0.85 weight's, based on the total weight of (I) or Good's buffer. (I) is a multipurpose solution for care of a contact lens and is suitable for contact lens disinfection, storage, cleaning, conditioning, rehydrating, moistening and lubricating (I) is useful for disinfecting the contact lens or contact lens storage vessel such as contact lens vial, contact lens or contact lens storage vessel such as contact lens vial, contact lens or exercise the shipping package by contacting the lens or vessel with a disinfecting solution comprising (I). (I) is useful for packaging a contact lens involving sealing the lens in a container with (I), where the contact lens is not autoclaved. (I) reduces the number of pseudomonas aeruginosa, Staphylococcus aureus and Serratia marcescens organisms by 3.0 logs or more within 4 hours and the number of candida albicans and Fusarium solani by 1.0 log or more within 18 hours. (I) is call-preserving and requires no additional preservatives or callination to the eye. (I) enables immediate application of the contact lens to the eye components of (I). The present sequence is that of an indolicidin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                         Ophthalmic composition for storing, cleaning, or disinfecting contactens, comprises indolicidin, and buffer having specified halide ion concentration or Good's buffer.
                                                                                                                                                                                                                                                                                                 Hokama LA, Selsted ME, Chapoy LL,
